Cannabis: not a new medicine

Main Events that Reawakened Interest in Medicinal Cannabis in the 1990s

- Persistent anecdotal reports of benefits
- Political shifts favoring medicinal access (in USA 23 states now provide for some measure of access)
- Discovery of the endocannabinoid system
 - » CB1 and CB2 receptors
 - » Anandamide (Devane, Mechoulam, et al Science 1992)
 - » 2-arachidonoylglycerol (2-AG: Sugiura, et al., Mechoulam et al., 1995), and other signaling molecules
 - » Development of synthetic molecules: agonists, partial agonists, antagonists, and other modifiers (eg., inhibitors of fatty acid amide hydrolase (FAAH). FAAH breaks down anandamide)

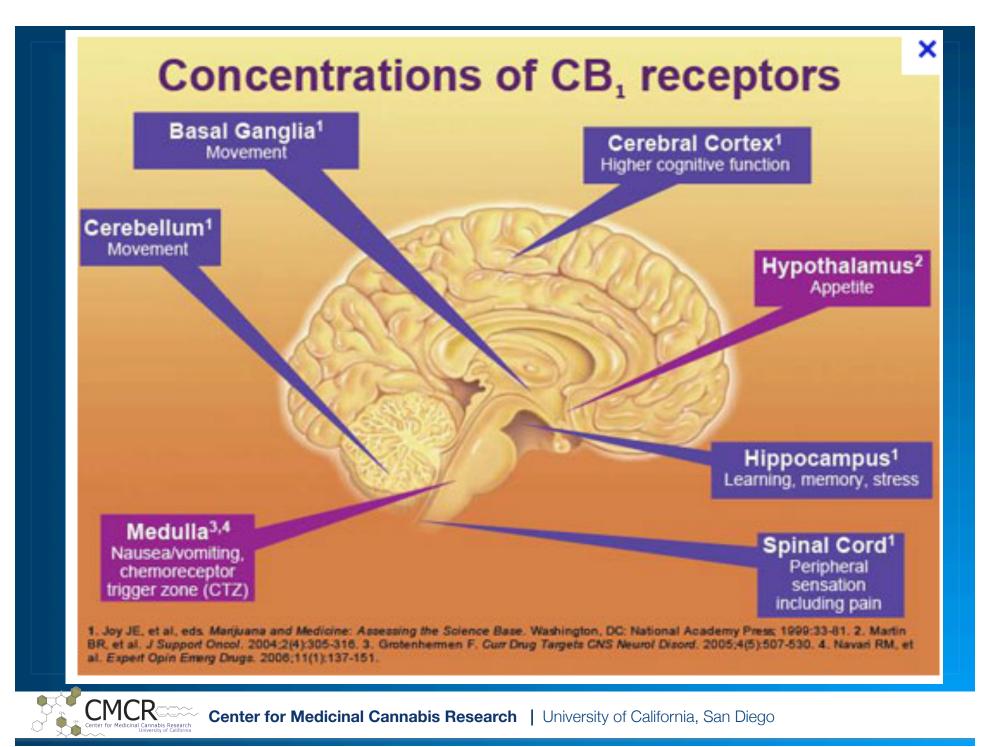

Distribution of CB1 Receptors

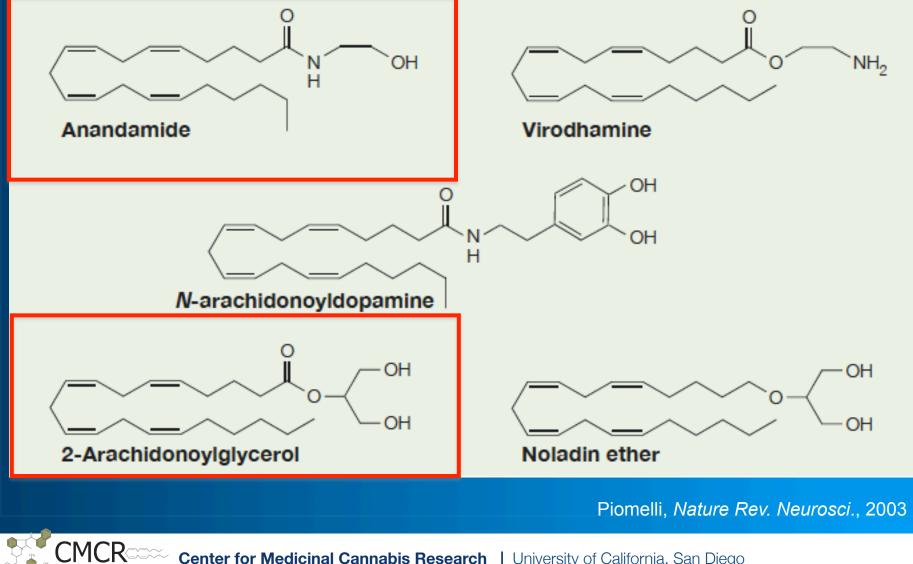

Green shading indicates distribution of cannabinoid receptors in the body

- CNS
- Intestine
- Liver

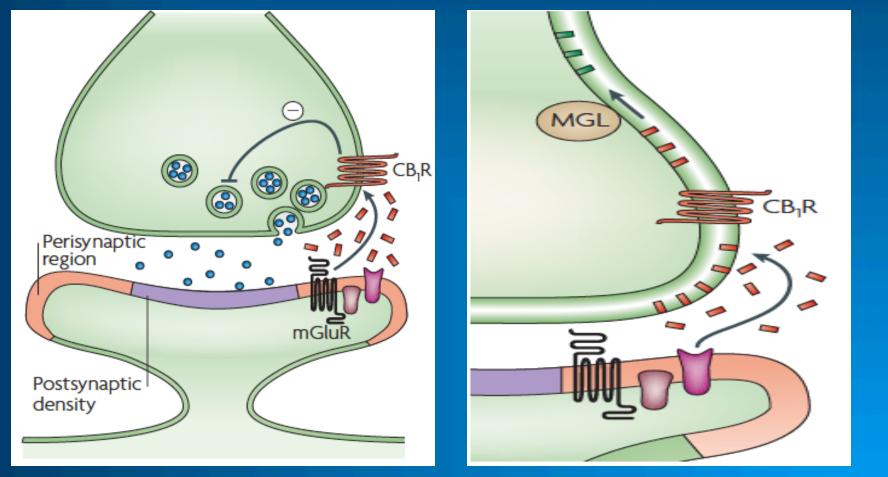

© CCIC ^{TM 2010} www.ccic.net

The endogenous cannabinoids

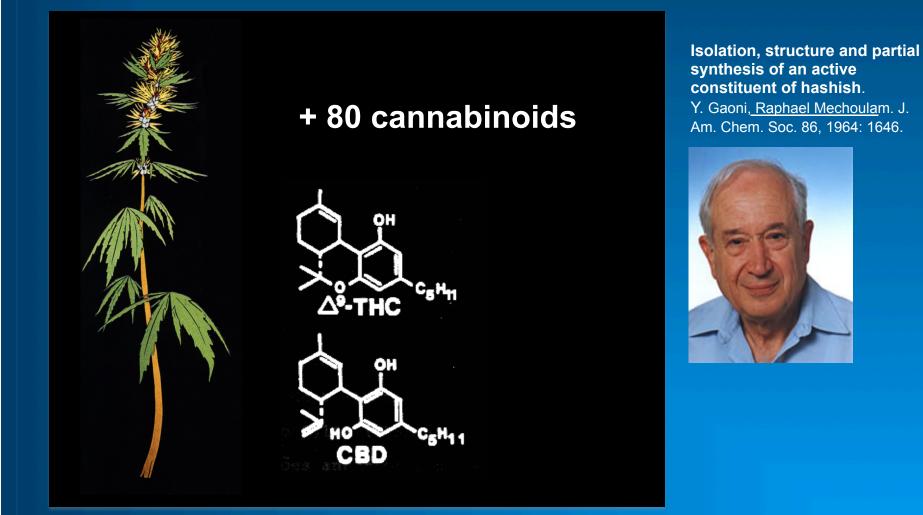

"Circuit Breaker" Function of CB Receptors Neurotransmitter (eg., glutamate) action on post synaptic cells triggers them to release endocannabinoids (EC) that act on presynaptic CB receptors to regulate neurotransmission. The EC are then inactivated by FAAH or MGL*

* FAAH = fatty acid amide hydrolase MGL = monoglyceride lipase (Courtesy D. Piomelli, UCI)

Marijuana Compounds

Potential Medicinal Uses of Cannabis: NIH & IOM Reviews in late 90s

The NIH Workshop on the Medical Utility of Marijuana (1997) and the Institute of Medicine (1999), following thorough review, identified medical conditions warranting further research regarding the possible therapeutic effects of cannabis.

- Appetite Stimulation
- Nausea and Vomiting
- Analgesia
- Neurological and Movement Disorders

California Events Leading To CMCR

November 1996:	California Prop 215 passes: Compassionate Use Act
September 1999:	Medical Marijuana Research Act of 1999, authored by Senator John Vasconcellos.
August 2000:	Center for Medicinal Cannabis Research established at the University of California.
September 2003:	Amendment to Medical Marijuana Research Act of 1999, sunset restrictions removed.

CMCR Abrams et al study: Cannabis reduces HIV Neuropathic Pain

Placebo controlled double blind randomized trial of 4% THC containing vs 0%THC MJ cigarettes administered 3x/day for 5 days.

Source: Abrams, D. I. et al. Neurology 2007;68:515-521

CMCR Clinical Studies completed

SITE	DISORDER	DESIGN	Ν	DOSE (% THC)	Result
UCSD Mark Wallace	Healthy Volunteers (Experimentally-Induced Pain)	Crossover RCT	15	0%, 2%, 4%, 8%	+
UCSF Donald Abrams	HIV Neuropathy, Experimental Pain	Parallel Groups RCT	50	0%, 3.5%	+
UCSD Ronald Ellis	HIV Neuropathy	Crossover RCT	28	0%, 1-8%	+
UCD Barth Wilsey	Neuropathic Pain, Experimental Pain	Crossover RCT	33	0%, 3.5%, 7%	+
UCD Barth Wilsey	Neuropathic Pain	Crossover RCT	39	0%, 1.29%, 3.53% (Vaporized)	+
UCSD Jody Corey- Bloom	MS Spasticity	Crossover RCT	30	0%, 4%	+
UCSD Mark Wallace	Diabetic Neuropathy	Crossover RCT	16	0%, 2%, 4%, 7%	+

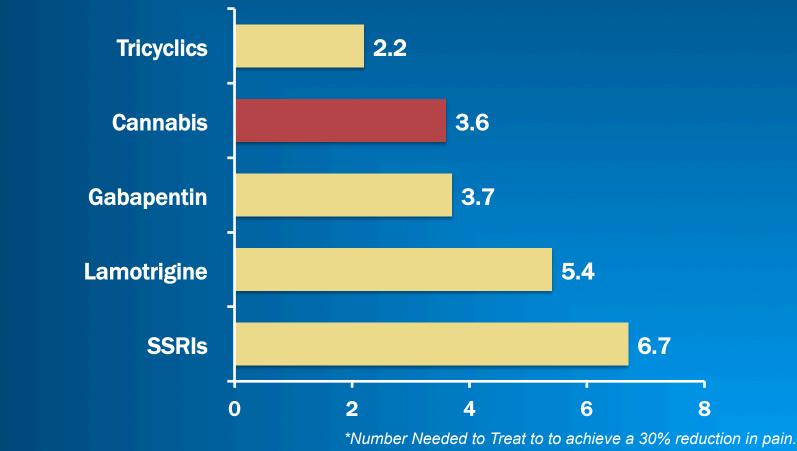

How effective is cannabis relative to other pain medications? Number-Needed-to-Treat

- Number-Needed-to-Treat (NNT) = 1/Proportion improved in experimental condition – Proportion improved on placebo
- Ex: If 30% reduction in pain intensity = "Improved" and 60% "improve" in the experimental condition, while 30% "improve" in the placebo condition, then 0.60 – 0.30
 = 0.30 and

NNT = 1/.30 = 3.3

Common Analgesics for Neuropathic Pain

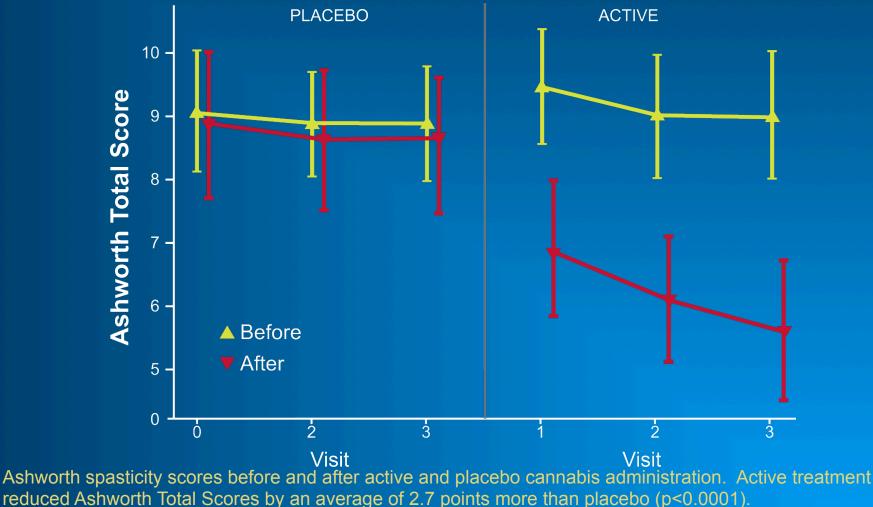

Number Needed to Treat

CMCR Study by Corey Bloom et al:

Cannabis improves MS spasticity in brief placebo controlled randomized study of 30 patients receiving 0% or 4% THC $(1x/d \times 3 d)$

Source: Corey-Bloom, et al. (2012) CMAJ 184(10); 1143-1150.

Summary of CMCR Studies on Smoked Cannabis

- Data from CMCR placebo controlled, limited scale studies of smoked cannabis indicate positive response in patients with neuropathic pain (3 studies) as well as reduced pain in a neuropathic pain model of nonpatients (1 study), with effect sizes similar to other agents
- One CMCR study also found smoked cannabis reduced spasticity in MS patients
- Side effects were generally mild, with commonest being subjective high, fatigue, and tachycardia
- Neurocognitive testing revealed small reversible decrements during active treatment; comparable to effects of benzodiazepines, and antispasm, antiepileptic drugs for neuropathic pain and spasm
- Other side effects were sedation, dizziness, cough, throat irritation; all reversible and none necessitating discontinuation

Acute and Short Term Adverse Effects Reported in Clinical Trials Literature

Medical & Neurological

- Dizziness (50%)
- Dry Mouth (25%)
- Fatigue (25%)
- Muscle complaints eg., weakness, myalgia (15%)
- Palpitations (20%)
- Ataxia (10%)
- Syncope (<5%)
- Hypotension (<5%)

Neuropsychiatric

- "High" or Intoxicated (dose dependent)
- Neurocognitive (dose dependent)
 - » processing speed
 - » perceptual (time sense; visual; other senses)
 - » reaction time
 - » attention
 - » recall
- Euphoria (5-25%)
- Anxiety (5-25%)
- Paranoia/Psychosis (< 1%)</p>

Although it may be effective, smoked marijuana as medicine presents challenges

- » Safety of combustible material in clinical setting
- » Second hand smoke as an irritant, possibly health hazard
- » Efficiency and tolerability in smoking naïve
- » Availability of cigarettes with standardized dose
- » Conflict with anti drug laws
- » Possibility of misuse and diversion
- » Difficulty in conducting clinical trials on Schedule I substance whose legal availability is limited

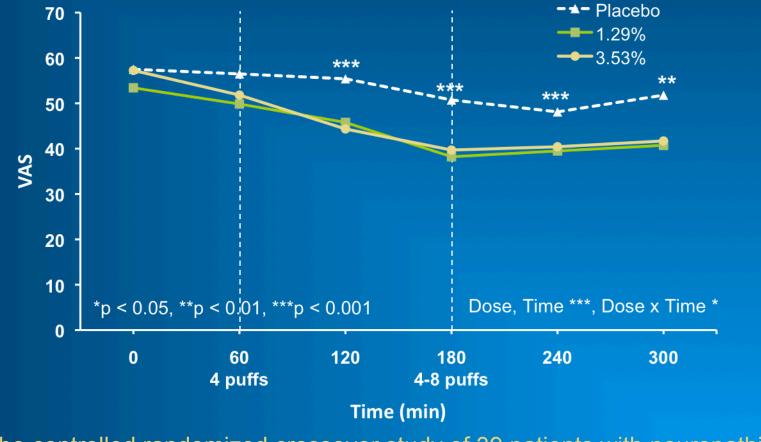

Alternative Delivery Systems: "Volcano"

- Cannabis heated to 180°C
- Below the point of combustion (230°C)
- Releases cannabinoids as vapor into balloon
- Inhaled via mouthpiece attached to balloon

STORZ & BICKEL GMBH & CO. KG

CMCR Wilsey vaporizer study: Low dose THC containing cannabis reduces neuropathic pain

Placebo controlled randomized crossover study of 39 patients with neuropathic pain of mixed etiology treated 2x/d. THC conc. = 0%; 1.3%; 3.5%

Source: Wilsey, et al. Journal of Pain, 2013.

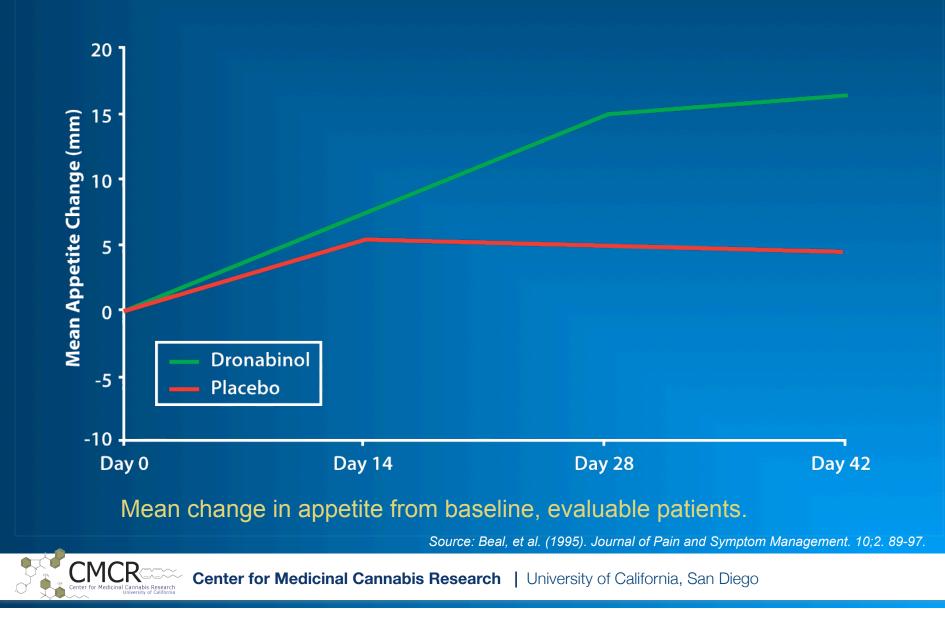

Other current or potential cannabinoid modulators

Agonists

- » THC/CBD plant extract, eg., Nabiximols)
- » Synthetic THC (Dronabinol [Marinol] & analogs]: Nabilone [Cesamet]; selective CB1 or CB2 agonists)
- Antagonists, partial agonists
 - » (Rimonabant, Taranabant, etc)
- Modifiers of endocannabinoid metabolism
 - » Fatty Acid Amide Hydrolase (FAAH) inhibitors; possibly monoglyceride lipase (MGL) inhibitors

Dronabinol for Appetite Stimulation

Nabiximols (Sativex®) oral mucosal spray

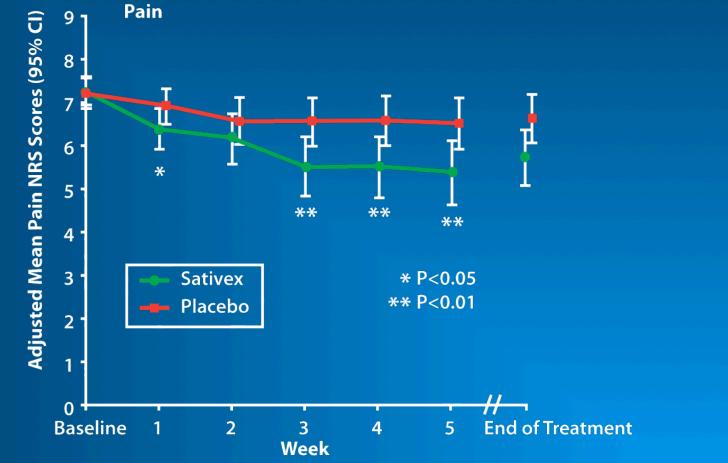

- Pump action oral mucosal spray
- Delivers 0.1 ml per spray of solution containing 25 mg/ml THC and 25 mg/ml CBD
- Derived from botanical sources, thus contains other cannabinoids and non cannabinoids (eg., flavonoids; terpenes)

Image courtesy G. Guy, GW Pharmaceuticals

Nabiximols (Sativex®) for Neuropathic Pain

Reduction of global neuropathic pain NRS scores in the two groups during the trial. Weekly mean pain scores were obtained from pain diaries.

Source: Nurmikko, et al. (2007). Pain. 133; 210-220

Cannabidiol - CBD

- Natural component of the Cannabis plant
- Constitutes up to 40% of marijuana extracts
- Devoid of typical psychological effects of THC
- Evidence for:
 - » Anti-inflammatory
 - » Analgesia
 - » Anti-nausea
 - » Hypnotic and sedative

- » Antipsychotic
- » Anticonvulsive
- » Neuro-protective
- » Anxiolytic
- » Others
- Antagonism of ∆9-THC when both contents are administered concomitantly? FAAH inhibition?

Role for cannabinoids in schizophrenia treatment? Some evidence for cannabinoid involvement

- Heavy MJ use associated with increased risk of psychosis in some studies; THC itself can produce acute psychosis
- PCP administration (animal model of psychosis) associated with regional brain increase in 2 AG
- Human PET studies show increase in CB1 binding in various brain regions in untreated schizophrenia
- Serum/CSF anandamide increased during onset of psychotic symptoms, but not in heavy MJ users
- Higher CSF anandamide associated with less likely transition to psychosis in "high risk" cases
- In psychosis cases treated with cannabidiol, improvement in negative symptoms associated with greater CSF anandamide rise

Cannabidiol improves positive and negative symptoms of schizophrenia:

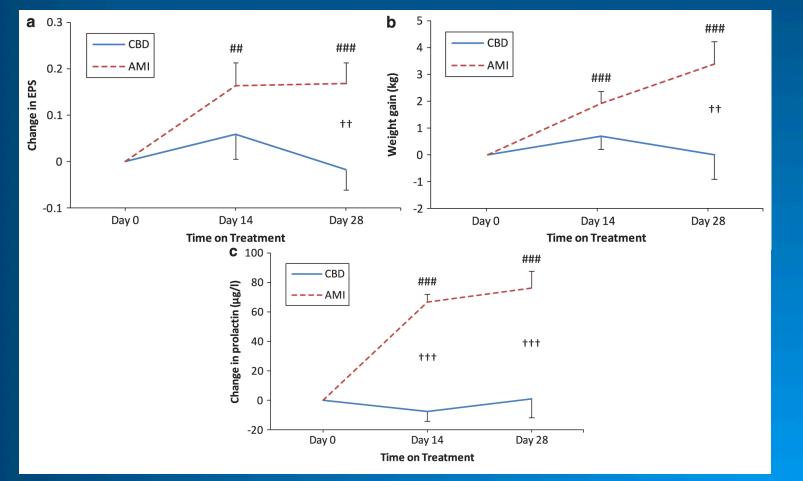

(42 cases randomized to receive 800 mg/d cannabidiol or amisulpride)

Leweke FM, Transl Psychiatry. 2012 Mar 20;2:e94.

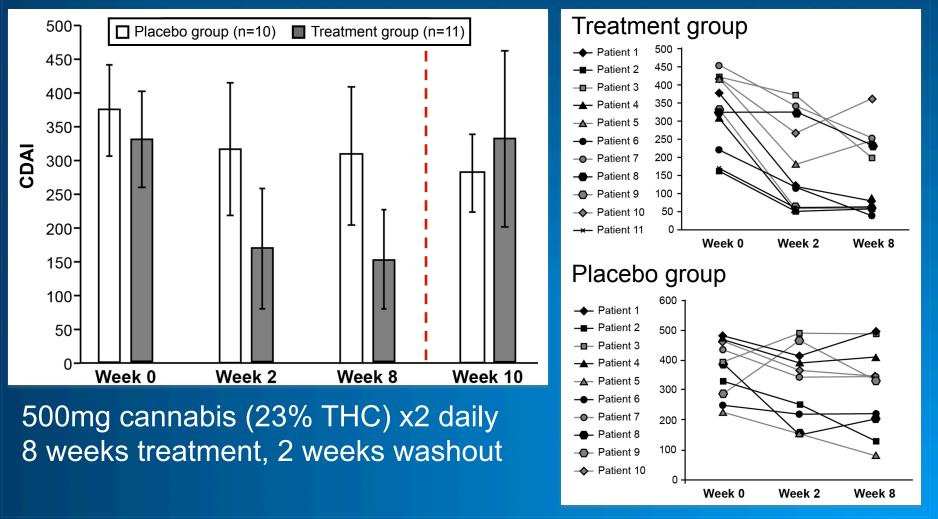

Compared to atypical antipsychotic amisulpirde, cannabidiol does not worsen extrapyramidal symptoms, and is not associated with weight gain or elevated prolactin

Leweke FM, Transl Psychiatry. 2012 Mar 20;2:e94.

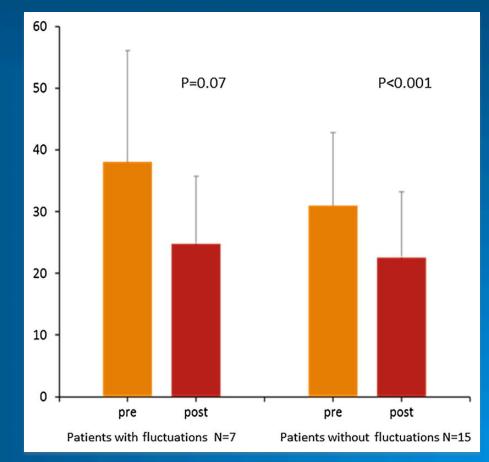

Cannabis Induces a Clinical Response in Patients With Crohn's Disease

Source: Naftali T, et al. Clin Gastroenterol Hepatol. 2013 Oct;11(10):1276-1280.e1. doi: 10.1016/j.cgh.2013.04.034. Epub 2013 May 4.

Smoked Cannabis Treatment for Motor and Non–Motor Symptoms of Parkinson Disease

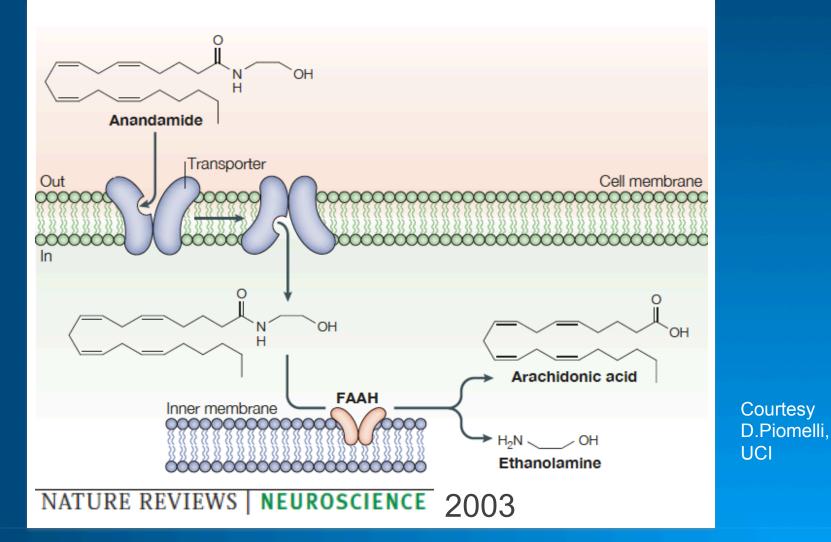

Pre- and Post-treatment motor UPDRS score in 22 patients with and without response fluctuations 30 minutes after smoking 500mg cannabis.

FAAH inhibitors as therapeutic agents?

Peripheral FAAH inhibitor URB937 efficacious in animal model of post-surgical pain

Courtesy D. Piomelli, personal communication

Center for Medicinal Cannabis Research

Summary of current status of Medicinal Cannabis/ Cannabinoid Modulators

- Smoked/vaporized cannabis, and extracts containing THC/CBD mix probably efficacious in neuropathic pain and spasticity from MS
- Very early data on possible efficacy of cannabis in Crohn's Disease, Parkinson's. Confirmation needed.
- Synthetic THC-like molecules efficacious in appetite stimulation and control of nausea
- Potential utility of synthetic CB1 agonists not yet established
- CB1 antagonists, partial agonists may be useful in appetite suppression, but adverse psychiatric effects have been problematic
- Cannabidiol showing initial promise in treatment of anxiety, psychosis, and there are case reports on benefits for intractable epilepsy
- FAAH inhibitors promising in animal models of chronic pain
- Anti-inflammatory actions of cannabinoids deserve further exploration

How do we move forward? Let's clear away the smoke and get past the heat and into the scientific light!

- We need to separate out discourse on medicinal cannabis from that of broader social policy on recreational use [as we have done with other potentially abusable substances]
- We need serious larger scale clinical trials on cannabis, administered via several routes, and specific constituents, plus their combinations.
- Governments are the logical sponsors of such trials, as there is not an immediate incentive for pharma to be involved. Tax dollars collected from cannabis sales can support such studies, which should also focus on longer term benefits, and possible individual toxicity, and broader social harm.
- In the USA and other jurisdictions regulatory authorities need to "re-schedule" cannabis away from the most restrictive schedule, recognizing that harm potential is modest, and there are likely medical benefits. This will facilitate medical research
- If cannabis is to be used as a medicine, it needs to be capable of MD prescription, in accordance with agreed protocols, and subject to availability from trusted sources that confirm potency and purity, and regulated dispensing [eg., pharmacies; regulated dispensaries]

Health Consequences of Cannabis: Causal Evidence Unclear (?) for Many Major Concerns

Medical

- Respiratory Infection; chronic lung disease?
- Cancers ?
- Myocardial Infarction ?
- Teratogenicity?
- Fatal Overdose Not Reported

Neuropsychiatric

- Dependence
- Persisting Neurocognitive impairment?
- Psychotic disorder?
- Neurodevelopmental maturation

Public Health

- Traffic Accidents
 - Cannabis ?
 - Alcohol
 - Cannabis + Alcohol
- Scholastic and occupational difficulties
- "Gateway drug"?

Medicinal Cannabis

Thank you
